

System Workflow & Flowcharts

How a job moves from a phone booking to a closed, reviewed record — through two photo-evidence approval gates that keep field work verifiable end to end.

- Booking Desk
- Approval gates
- Super-Admin Calendar
- Notifications
- Staff ratings

01

What was requested, and what shipped

Every item from the spec (C1–C9) is built. Code compiles and the production build is green.

#	SPEC ITEM	STATUS	WHERE
C1	Booking Desk — merge Customers + Bookings + Schedule	Done	/booking-desk
C2	Work Photos & Approvals	Done	/work-approvals
C3	Super-Admin Calendar — colour-coded, drawer, per-worker day	Done	/calendar
C4	Time scheduling + assignment — start time, duration, supervisor, conflicts, attendance	Done	Job edit
C5	Pre-work check — machinery + uniform/mask, approval gate	Done	Field app
C6	Notifications — in-app bell + badges	Done	Topbar
C7	Mid-job reschedule — notify crew, audit	Done	Calendar
C8	Completion approval — completion photos, gate	Done	Field app
C9	Review & staff rating — closes the job	Done	Reviews

Testing status: everything compiles and builds; the full end-to-end run against the spec on the live database is the one remaining step.

High-level architecture

UI → edge auth → API → service layer (the only place that touches the database) → models.

Every status change runs through one shared gate; every action is audited.

One app, no native mobile app. The whole system is a single installable **PWA**. The "field app" is the same website opened in a technician's **phone browser** — add-to-home-screen makes it feel app-like (icon, offline, push), but there's no separate iOS/Android app to build or publish.

The job lifecycle — full state machine

The heart of v2: a job runs through **two approval gates** before it can complete, then closes after the review.

● Scheduled ● Pre-work / on-site ● In progress ● Completion approval ● Completed / closed ● Cancelled

Approvers = admins + the job's designated supervisor.

Booking Desk — one screen (C1)

Replaces the old Customers → Bookings → Schedule hop. A booking always spawns a job automatically.

Scheduling, assignment & the calendar (C3 + C4)

Conflict checks compare time *ranges* (start → start + duration) with a travel buffer, and each worker chip shows today's attendance so you don't book an absent crew.

Calendar: month / week / day (list or per-worker columns); click a job
→ drawer for detail, reschedule, manage, photos.

Pre-work approval loop (C5)

The field ↔ office handshake. A worker cannot start cleaning until pre-work is approved — the path is blocked server-side.

Completion approval loop (C8)

Review & close + staff rating (C9)

Capturing the customer review is what closes the job. Reports count both **completed** and **closed** as done, so numbers never drop when a job closes.

Notifications (C6)

Each lifecycle event writes an in-app record and fires a best-effort web-push. Bell for both roles; badge on the admin sidebar.

Data model — v2 additions

New collections: `JobSubmission`, `Notification`, `StaffRating`. Extended: `Job`,
`Booking`, `Photo`, `Review`.

End-to-end happy path
